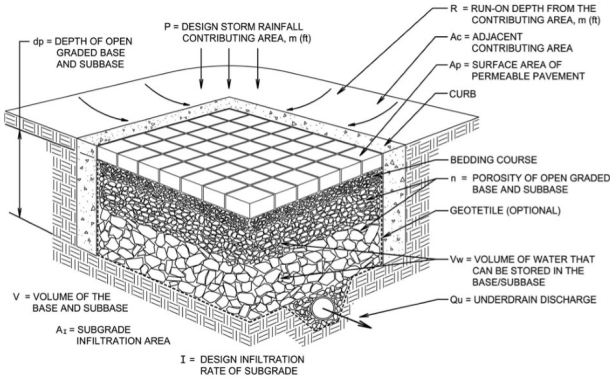
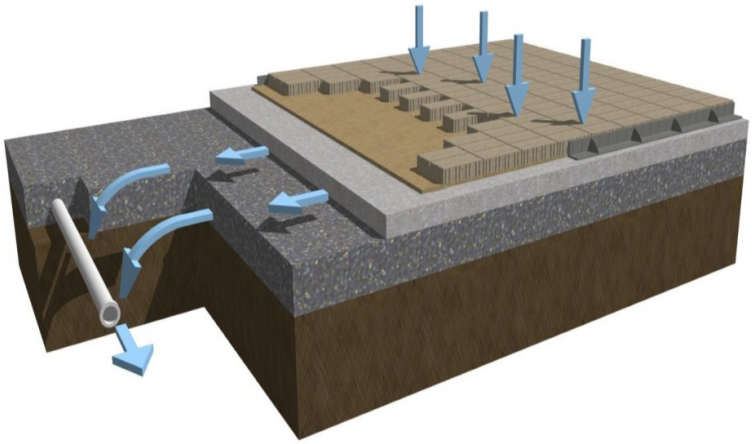
Convert your driveway or parking areas into a Bowers Permeable Pavement and take care of the storm water without having to use tanks





The Bowers Permeable Systems allow storm water to percolate and infiltrate the surface areas traditionally impervious to the soil below. These systems can control storm water at the source, reduce runoff and improve water quality by filtering pollutants in the substrata layers which are detrimental to our waterways.

Permeable Pavers are one of the solutions for storm water management in the Proposed Auckland Unitary Plan.

Bowers have design software to calculate what will satisfy your requirements for your storm water management in your area (run off from the roof can be included). We can do a structural and hydrological design for light vehicular applications and then get certified contractors to give you a price.

Contact us for more details of the various products that are available and for technical advice.
